LEUCOCYTOSIS – GP REFERRAL GUIDELINES

Introduction

Leucocytosis is defined as an elevation of white cell count to \(>10.5 \times 10^9/l\). It has a wide differential diagnosis ranging from normal response to infection through to haematological malignancies including acute leukaemias. Detection of a leucocytosis should prompt scrutiny of the differential white cell count, other FBC parameters and blood film examination.

The following should be referred by telephone for immediate haematology assessment:

- New suspected Acute leukaemia
- New suspected Chronic myeloid leukaemia with either:
  - White cell count \(>100 \times 10^9/l\)
  - Hyperviscosity symptoms (Headache, visual loss, acute thrombosis)

*The duty haematologist will contact the general practice following the results of FBC and blood film examination and arrange urgent patient assessment / admission.*

The following should be referred urgently for outpatient assessment:

- Leucoerythroblastic blood picture (from blood film report)
- New chronic myeloid leukaemia not meeting the above criteria
- Unexplained leucocytosis with white cell count \(>50 \times 10^9/l\)

**Appropriate investigation in primary care for patients not meeting criteria for urgent referral:**

- Blood film examination with differential white cell count
- Careful history and assessment for ‘reactive’ causes: infection, inflammation or neoplasia
- Examination for lymphadenopathy, splenomegaly
- Biochemistry
- Consider CXR

**Referral for specialist opinion should be considered for:**

- Persistent (at least on two occasions 4-6 weeks apart) unexplained:
  - White cell count \(>20 \times 10^9/l\)
  - Neutrophilia \(>15 \times 10^9/l\)
  - Eosinophilia Monocytosis
